Equilibrium allocation of education resources is the foundation and prerequisite. And it is the requirement of the current national policy in China. There are much disparities of basic education resources allocation in our country now. Chongqing is the reform pilot area of urban and rural education, and the study of equilibrium allocation of rural and urban education resources is more urgent. According to the status quo and problems of resources allocation of the basic education in Chongqing and analysis of the literature data, a index system is constructed on human, finance and material resources. The index system is constituted by the layers of objectives, standards and indicators, and it is measured by the Gini Coefficient and Theil Index. Then the evaluation model and criterion of equilibrium are constructed. Finally, the evaluation methods, monitoring tools and effective advices of equilibrium allocation of resources are provided.

Key words: allocation of resources; index system; criterion of equilibrium; measurement methods
